Terminology

Derivatives: Any financial instrument that is derived from another e.g. options, warrants, futures, swaps **Option:** gives the holder the right to buy or sell a security at a specified price during a specified time period **Call Option:** The right to buy a security at a specified price within a specified time **Option Premium:** The price paid for the option, above the price of the underlying security **Intrinsic Value:** Difference between the strike price and the stock price **Time Premium:** Value of option above the intrinsic value **Exercise Price:** (Strike Price) The price at which you buy or sell the security **American Option:** Can be exercised at any time prior to and including the expiration date **European Option:** Can be exercised only on the expiration date **Exercise price** \uparrow : **Call Price** \downarrow , **Put Price** \uparrow **Put Option:** The right to sell a security at a specified price within a specified time **Butterfly Straddle**
Strategy of buying a call: **Bild einfügen** **Value of company's assets** \uparrow , **Value of default put** \downarrow **Std dev asset value** \uparrow , **Value of default put** \uparrow **Amount of outstanding debt** \uparrow , **Value of default put** \uparrow **Debt maturity** \uparrow , **Value of default put** \uparrow **Default-free interest rate** \uparrow , **Value of default put** \downarrow **Dividend payments** \uparrow , **Value of default put** \uparrow **Indenture or trust deed:** The bond agreement between the borrower and a trust company **Registered bond:** A bond in which the company's records show ownership and interest and principal are paid directly to each owner. **Bearer bonds:** The bondholder must send in coupons to claim interest and must send a certificate to claim the final payment of principal **Accrued interest:** The amount of accumulated interest since the last coupon payment **Coupon:** Interest paid on a bond **Debentures:** Long-term unsecured issues on debt **Mortgage bond:** Long-term secured debt, often containing a claim against a specific building or property **Collateral trust bonds:** Bonds secured by common stocks or other securities that are owned by the borrower **Equipment trust certificate:** Secured debt generally used to finance railroad equipment. The trustee retains equipment ownership until the debt is repaid. **Asset-backed securities:** The sale of cash flows derived directly from a specific set of bundled assets **Mortgage-backed securities:** Package of mortgage loans sold; owners of package receive portion of mortgage payments **Callable bond:** Allows the issuer to repay the debt, valuable to reduce leverage **Puttable (retractable) bond:** Allows the investor to be repaid for the debt, A protective covenant for the investor **Sinking fund:** A fund established to retire debt before maturity **Bond covenants:** Debt ratios, Security, Dividends, Event risk, (+) working capital, (+) net worth **Lease:** Rental agreement that involves fixed payments from lessee to lessor (*Reasons: convenient, provided maintenance, low cost through standardization, tax shields, financial distress, avoid capital expenditure controls, preserve capital off-balance sheet financing*) **Direct Lease:** The lessor buys the equipment from the manufacturer **Full Service Lease:** The lessor provides maintenance and insurance **Operating Lease:** The initial lease period is shorter than the economic life of the asset **Financial Lease:** The initial lease period is long enough for the lessor to recover the cost of the asset **Net Lease:** The lessee provides maintenance and insurance **Leveraged Lease:** The lessor finances the lease contract by issuing debt and equity claims against it **Sale and Leaseback:** The lessors buys the equipment from the prospective lessee **Spot price:** Price paid for immediate delivery **Forward vs futures contract:** Both contracts buy or sell at a specified future date at a specified price. However, compared to forwards, futures are traded on an exchange and they are marked to market. *Futures fixes a price which has to be payed if market value is higher or lower* **Long vs short position:** Investors who are long have agreed to buy the asset. Investors who are short have contracted to sell. **Basis risk:** The risk that arises because the price of the asset used to hedge is not perfectly correlated with that of the asset that is being hedged. **Mark to market:** Profits and losses on a position are settled on a regular basis **Net convenience yield:** The advantage from owning the commodity rather than the promise of future delivery less the cost of storing the commodity **Exchange Rate:** Amount of one currency needed to buy one unit on another **Spot Rate of Exchange:** Exchange rate for an immediate transaction **Forward Exchange rate:** Exchange rate for a forward transaction **Trade Credit:** Receivables from one company to another **Consumer Credit:** receivables from consumers **Terms of sale:** Credit, discount, and payment terms offered on a sale **Credit Analysis:** Procedure to determine the likelihood a customer will pay its bills **Credit Policy:** Standards set to determine the amount and nature of credit to extend to customers **Credit Scoring:** What your lender won't tell you **Collection Policy:** Procedures to collect and monitor receivables **Factoring:** Arrangement whereby a financial institution buys a company's accounts receivable and collects the debt

Formulas

Put-Call-Parity

Formulas

Put-Call-Parity

$$C + PV(EX) = P + S$$

where:

- C = Price of the European call option
- $PV(EX)$ = Present value of the strike price = $\frac{Ex.Price}{(1+r)}$
- P = Price of a European Put
- S = Share Price

Option Δ

$$Option\Delta = \frac{C_u - C_d}{S_u - S_d} = \frac{P_u - P_d}{S_u - S_d}$$

where:

- C_u = Call upside
- C_d = Call downside
- P = Put
- S = Stock

Risk neutral probability of rising value

$$p^* = \frac{(1+r) - d}{u - d}$$

where:

- r = Interest rate
- d = Relative downward change
- u = Relative upward change

Expected Value

$$ExpectedValue = (p^* * PayOff_u) + ([1 - p^*] * PayOff_d)$$

Present Value

$$PresValue = \frac{ExpectedValue}{(1+r)} = ValShares - ValLoan$$
$$ValueLoan = \frac{ValueShares_d}{(1+r)}$$

Up and Down Changes

$$1 + UpsideChange = u = e^{\sigma * \sqrt{h}}$$

$$1 + DownsideChange = d = \frac{1}{u}$$

where:

- σ = Standard Deviation
- h = Fraction of Year

Black-Scholes Formula (weg wenn zu viel)

$$C = (N[d_1] * S) - (N[d_2] * PV[EX])$$

$$d_1 = \frac{\log(\frac{S}{PV[EX]})}{\sigma * \sqrt{t}} + \frac{\sigma \sqrt{2}}{2}$$

$$d_2 = d_1 - \sigma \sqrt{t}$$

where:

- C = Call Value
- $N[d]$ = Cumulative normal probability
- $PV(EX)$ = Ex. Price at risk-free interest rate
- S = Stock price
- t = number of periods to exercise date
- σ = Standard Deviation
- if d_1 is large, $N(d_1)$ is close to 1.0*
- if d_1 is zero, $N(d_1)$ is close to 0.5*

Present Value Formula BOND

$$PV = \sum_{t=1}^T \frac{cpn}{(1+r)^t} + \frac{par}{(1+r)^T}$$

$$PromisedYield = \frac{Payoff}{PV} - 1$$

where:

- cpn = Coupon rate
- r = Interest rate
- T = Number of periods
- par = Face value

Predicting Default: Altman's Z-score

$$Z = 1.2x_1 + 1.4x_2 + 3.3x_3 + 0.6x_4 + 1.0x_5$$

where:

- x_1 = working capital/total assets
- x_2 = retained earnings/total assets
- x_3 = earnings before interest and tax (EBIT)/total assets
- x_4 = market value of equity / total liabilities
- x_5 = sales/total assets

Convertible Securities

$$ConversionPrice = \frac{FaceValue(1000\$)}{ConversionRatio}$$

$$ConversionValue = Conversionratio * shareprice$$

Take or Die

Expansion Options: Uncertainty \uparrow - Value of exp. option \uparrow **Value of a call (takeaways):**

- Never worth more than the stock price itself.
- When the share is worthless, the option is worthless.

Lease or Buy

- Buy if equivalent annual cost of ownership and operation is less than the best lease rate
- For using extended periods, buying tends to be cheaper
- Leasing, because lessor might be able to manage asset at less expense than lessee
- Leasing has useful options in leasing agreement

$$NPV_{lease} = InitialFinancing - \sum_{t=1}^T \frac{LeaseCashFlow}{[1 + r_D * (1 - T_c)]^t}$$

$$NPV = PV_{EquivalentLoan} + InitialFinancing$$

- r_D = discount rate
- t_c = marginal tax rate

Managing Risks

Risks to a business: Cash shortfalls, Financial distress, Agency costs, Currency fluctuations, Political instability, Weather changes

Pricing Futures Contracts

$$F_t = S_0 * (1 + r_f - y)^t$$

$$= S_0 * (1 + StorageCost - CY)^t$$

$$NCY = ConvenienceYield - StorageCost$$

- F_t = future price on contract of t length
- S_0 = today's spot price
- r_f = risk-free interest rate
- y = dividend yield
- NCY = NetConvenienceYield

Hedging Ratios and Basis Risk

$$ExpectedChangeInValueA = \alpha + \delta * (ChangeInValueB)$$

- δ = sensitivity of A to change in the value of B (hedge ratio)
- α = offset

Premium- Discount Relationship

$$ForwardDiscount = \frac{1}{t_{years}} * (\frac{SpotPrice}{ForwardRate} - 1)$$

$$MarketCapitalization(MC) = \#SharesOutstd * SharePrice$$

$$MarketValueAdded(MVA) = MC - Equity_{BookValue}$$

$$MarketToBookRatio = \frac{Value_{Market}}{Value_{Book}}$$

Growth and External financing

SustainableGrowthRate: Highest growth rate a firm can maintain without increasing its financial leverage

$$\begin{aligned} InternalGrowthRate &= \frac{ReinvestedEarnings}{NetAssets} \\ &= \frac{ReinvestedEarnings}{NetIncome} * \frac{NetIncome}{Equity} * \frac{Equity}{NetAssets} \\ &= PlowBack * ReturnOnEquity * \frac{Equity}{NetAssets} \end{aligned}$$

$$SustainableGrowthRate = PlowbackRatio * ReturnOnEquity$$

The Operating and Cash Cycles

$$Op.Cycle(Days) = InventoryPeriod + AccountsReceivablePeriod$$

$$CashCycle(days) = Op.Cycle - AccountsPayablePeriod$$

Mergers

Horizontal Merger: One that takes place between two firms in the same line of business

Vertical Merger: Involves companies at different stages of production

Conglomerate Merger: Involves companies in unrelated lines of business

Binomial Method

$$Avg.InventoryPeriod = \frac{Inv.@StartOfYear}{DailyCostofGoodsSold}$$

$$Avg.ReceivablesPeriod = \frac{Receivables@StartOfYear}{DailySales}$$

$$Avg.PaymenPeriod = \frac{Payables@StartOfYear}{DailyCostofGoodsSold}$$

Inventory

Components:

- Raw materials
- Works in progress
- Finished Goods

The Goals is to minimize amount of cash tied up in Inventory **Tools to minimize:**

- Just-in-time
- As the firm increases its order size, the number of orders falls and therefore the order costs decline
- However, an increase in order size also increases the average amount in inventory, so that the carrying cost of inventory rises
- The trick is to strike a balance between these two costs

Economic Order Qty: Order size that minimizes total inventory costs (generally applicable formula with some limitations)

$$EOQ = \sqrt{2 * Sales * \frac{CostPerOrder}{CarryingCost}}$$

Trade Credit:receivables from one company to another

Consumer Credit:receivables from consumers

$$CreditDecision = prob.*PV(COST-REV) - (1-prob.)*PV(COST)$$
