Advanced Finance -Cheatsheet ehaller, seyohnp

Version: May 30, 2025

Terminology

Derivatives: Any financial instrument that is derived from another e.g. options, warrants, futures, swaps Option: gives the holder the

right to buy or sell a security at a specified price during a specified time period Call Option: The right to buy a security at a specified price within a specified time Option Premium: The price paid for the option, above the price of the underlying security Intrinsic Value: Difference between the strike price and the stock price Time Premium: Value of option above the intrinsic value Exercise Price: (Strike Price) The price at which you uby or sell the security American Option: Can be

exercised at any time prior to and including the expiration date European Option: Can be exercised only on the expiration date Exercise price ↑: Call Price ↓, Put Price ↑ Put Option: The right to sell a security at a specified price within a specified time But- where: Straddle Strategy of buying a call: Bild einfügen Value of company's as-

bond in which the company's records show ownership and interest

and principal are paid directly to each owner. Bearer bonds: The

a certificate to claim the final payment of principal Accrued in-

terest: The amount of accumulated interest since the last coupon

payment Coupon: Interest paid on a bond Debentures: Long-

term unsecured issues on debt Mortgage bond: Long-term secured

debt, often containing a claim against a specific building or prop-

erty Collateral trust bonds: Bonds secured by common stocks or

other securities that are owned by te borrower Equipmnet trust

certificate: Secured debt generally used to finance railroad equip-

ment. The trustee retains equipment ownership until the debt is repaid. Asset-backed securities: The sale of cash flows derived

directly from a specific set of bundled assets Mortgage-backed securites: Package of mortgage loans sold; owners of package re-

ceive portion of mortgage payments Callable bond: Allows the issuer to repay the debt, valuable to reduce leverage Puttable (re-

tractable) bond: Allows the investor to be reapid for the debt, A

protective covenant for the investor Sinking fund: A fund estab-

lished to retire debt before maturity Bond covenants: Debt ra-

lessee to lessor (Reasons: convenient, provided maintenance, low

cost through standardization, tax shields, financial distress, avoid

capital expenditure controls, preserve capital off-balance sheet fi-

nancing) Direct Lease: The lessor buy the equipment from the

manufacturer Full Service Lease: The lessor provides maintenance

and insurance Operating Lease: The initial lease period is shorter

than the economic life of the asset Financial Lease: The initial

lease period is long enough for the lessor to recover the cost of the asset Net Lease: The lessee provides maintenance and insurance

Leveraged Lease: The lessor finances the lease contract by issuing

debt and equity claims against it Sale and Leaseback: The lessors

buys the equipment from the prospective lessee Spot price: Price

paid for immediate delivery Forward vs futures contract: Both

contracts buy or sell at a specified future date at a specified price.

However, compared to forwards, futures are traded on an exchange and they are marked to market. Futures fixes a price which has to where:

be payed if market value is higher or lower Long vs short position:

Investors who are long have agreed to buy the asset. Investors who are short have contracted to sell. Basis risk: The risk that

sets ↑, Value of default put ↓ Std dev asset value ↑, Value of default put \(\tau \) Amount of outstanding debt \(\tau \). Value of default

put ↑ Debt maturity ↑. Value of default put ↑ Default-free in- \bullet S =Share Price terest rate ↑, Value of default put ↓ Dividend payments ↑, Value Option Δ of default put \(\tau \) Indenture or trust deed: The bond agreement between the borrower and a trust company Registered bond: A

Formulas

Put-Call-Parity

bondholder must send in coupons to claim interest and mus send where: • $C_u = \text{Call upside}$

> • $C_d = \text{Call downside}$ \bullet P = Put• $S = \mathsf{Stock}$

Risk neutral probability of rising value

receivable and collects the debt

 \bullet r =Interest rate

 \bullet d = Relative downward change

 \bullet u = Relative upward change

Expected Value

tios, Security, Dividends, Event risk, (+) working capital, (+) net worth Lease: Rental agreement that involves fixed payments from $ExpectedValue = (p^* * PayOff_u) + ([1 - p^*] * PayOff_d)$

Present Value

arises because the price of the asset used to hedge is not perfectly correlated with that of the asset that is being hedged. Mark

to market: Profits and losses on a position are settled on a regu-

lar basis Net convenience yield: The advantage from owning the commodity rather than the promise of future delivery less the cost

of storing the commodity Exchange Rate: Amount of one currency needed to buy one unit on another Spot Rate of Exchange: Ex-

change rate for an immediate transaction Forward Exchange rate: Exchange rate for a forward transaction Trade Credit: Receivables

from one company to another Consumer Credit: receivables from

consumers Terms of sale: Credit, discount, and payment terms

offered on a sale Credit Analysis: Procedure to determine the like-

lihood a customer will pay its bills Credit Policy: Standards set to

determine the amount and nature of credit to extend to customers

Credit Scoring: What your lender won't tell you Collection Policy:

Procedures to collect and monitor receivables Factoring: Arrange-

ment whereby a financial institution buys a company's accounts

C + PV(EX) = P + S

• PV(EX) = Present value of the strike price = $\frac{Ex.Price}{(1+r)}$

 $Option\Delta = \frac{C_u - C_d}{S} = \frac{P_u - P_d}{S}$

 $p^* = \frac{(1+r)-d}{r}$

 \bullet C =Price of the European call option

• P = Price of a European Put

 $PresValue = \frac{ExpectedValue}{(1+r)} = ValShares - ValLoan$

$$ValueLoan = \frac{ValueShares_d}{(1+r)}$$

Up and Down Changes

 $1 + UpsideChange = u = e^{\sigma * \sqrt{h}}$ $1 + DownsideChange = d = \frac{1}{-}$

• $\sigma = Standard Deviation$

• h = Fraction of Year

 $C = (N[d_1] * S) - (N[d_2] * PV[EX])$

Black-Scholes Formula(weg wenn zu viel)

Managing Risks

Pricing Futures Contracts

• $S_0 = \text{today's spot price}$

y = dividend yield

• $\alpha = \text{offset}$

Balance sheet

• $r_f = \text{risk-free interest rate}$

NCY = NetConvenienceYield

Hedging Rations and Basis Risk

Premium- Discount Relationship

Basic Relationships in the FX Market

Risks to a business: Cash shortfalls, Financial distress, Agency

costs, Currency fluctuations, Political instability, Weather changes

 $F_t = S_0 * (1 + r_f - y)^t$

 $= S_0 * (1 + StorageCost - CY)^t$

NCY = ConvenienceYield - StorageCost

 $ExpectedChangeInValueA = \alpha + \delta * (ChangInValueB)$

 $ForwardDiscount = \frac{1}{t_{vears}}*(\frac{SpotPrice}{ForwardRate} - 1)$

CurrSpotRate*Exp.Diff.InflationRates = Exp.SpotRate

 $r_{Real} = \frac{1 + r_{nom}}{1 + r_{exp}} - 1$

 $\frac{(1+r_{CHF})^t}{(1+r_{USD})^t} * S_{CHF/USD} = ForwardExchangeRates$

 $Req.Return = r_{Swiss} + \beta * MarketRiskPrem_{Swiss}$

· Current assets are inventories of raw materials, work in pro-

• Current liabilities include debts that are due to be repaid and

Net working capital is the difference between current assets

Assets are listed in declining order of liquidity

cess, and finished goods

and liabilities

• $\delta = \text{sensitivity of A to change in the value of B (hedge ration)}$

• F_t = future price on contract of t length

$$d_1 = \frac{\log(\frac{S}{PV[EX]})}{\sigma * \sqrt{t}} + \frac{\sigma\sqrt{2}}{2}$$

$$d_2 = d_1 - \sigma\sqrt{t}$$

ullet C = Call ValueN[d] = Cummulative normal probability

• PV(EX) = Ex. Price at risk-free interest rate

 \bullet S = Stock price \bullet t = number of periods tp exercise date • $\sigma = Standard Deviation$

 ifd₁islarge, N(d₁)iscloseto1.0 • ifd₁iszero, N(d₁)iscloseto0.5

Present Value Formlua BOND $PV = \sum_{t=1}^{T} \frac{cpn}{(1+r)^t} + \frac{par}{(1+r)^T}$

 $PromisedYield = \frac{Payoff}{PV} - 1$ cpn = Coupon rate

• r = Interest rate \bullet T =Number of periods

• par =Face value Predicting Default: Altman's Z-score

 $Z = 1.2x_1 + 1.4x_2 + 3.3x_3 + 0.6x_4 + 1.0x_5$ where:

• $x_1 = \text{working capital/total assets}$ • x_2 = retained earnings/total assets • $x_3 = \text{earnings before interest and tax (EBIT)/total assets}$

 \bullet $x_4 = \text{market value of equity / total liabilities}$ • $x_5 = \text{sales/total assets}$

Convertible Securities $ConversionPrice = \frac{FaceValue(1000\$)}{ConversionRatio}$

ConversionValue = Conversionratio * sharepriceTake or Die

Expansion Options: Uncertainty \uparrow - Valoue of exp. option \uparrow Value

• When the share is worthless, the option is worthless

of a call (takeaways): · Never worth more than the stock price itself.

• Buy if equivalent annual cost of ownership and operation is

• $r_D = \text{discount rate}$

• $t_c = \text{marginal tax rate}$

less than the best lease rate

• For using extended periods, buying tends to be cheaper

• Leasing, because lessor might be able to manage asset at

less expense than lessee

· Leasing has useful options in leasing agreement

 $NPV_{lease} = InitialFinancing - \sum_{t=1}^{T} \frac{LeaseCashFlow}{[1 + r_D*(1 - T_c)]^t}$ $NPV = PV_{EquivalentLoan} + InitialFinancing$

• Net working capital = \$10,890 - 14,243 = -\$3,353

EBIT = TotalRevelue - Costs - Deprication

$$MarketCapitalization(MC) = \#SharesOutstd*SharePri$$
 $Mergers$
 $MarketValueAdded(MVA) = MC - Equity_{BookValue}$
 $Value_{Market}$
Horizontaml Merger: One that takes place between two firms in the same line of business

 $Value_{Book}$

Growth and External financing

MarketToBookRatio =

SustainableGrowthRate: Highest growth rate a firm can maintain without increasing its financial leverage

$$Internal Growth Rate = \frac{Reinvested Earnings}{Net Assets}$$

$$= \frac{Reinvested Earnings}{Net Income} * \frac{Net Income}{Equity} * \frac{Equity}{Net Assets}$$

$$= Plow Back * Return On Equity * \frac{Equity}{Net Assets}$$

Binomial Method

business

Vertical Merger: Involves companies at different stages of pro-

Congomlerate Merger: Involves companies in unrelated lines of

SustainableGrowthRate = PlowbackRatio*ReturnOnEquity

The Operating and Cash Cycles

$$Op.Cycle(Days) = InventoryPeriod + AcountsReceivablePeriod$$

 $CashCycle(days) = Op.Cycle - AcountsPayablePeriod$

$$Avg.InventoryPeriod = \frac{Inv.@StartOfYear}{DailyCostofGoodsSold} \\ Avg.ReceivablesPeriod = \frac{Receivables@StartOfYear}{DailySales} \\ Avg.PaymenPeriod = \frac{Payables@StartOfYear}{DailyCostofGoodsSold} \\$$

Inventory Components:

- Raw materials
- Works in progress
- Finished Goods

The Goals is to minimize amount of cash tied up in Inventory Tools to minimize:

- Just-in-time
- As the firm increases its order size, the number of orders falls and therefore the order costs decline
- However, an increase in order size also increases the average amount in inventory, so that the carrying cost of inventory
- The trick is to strike a balance between these two costs

Economic Order Qty: Order size that minimizes total inventory costs (generally applicable formula with some limitations)

$$EOQ = \sqrt{2*Sales*\frac{CostPerOrder}{CarryingCost}}$$

Trade Credit:receivables from one company to another Consumer Credit:receivables from consumers

CreditDecision = prob.*PV(COST-REV) - (1-prob.)*PV(COST)
